

FEATURES:

- 1:1 and 1:2 registered buffer
- 1.8V Operation
- SSTL_18 style clock and data inputs
- Differential CLK input
- Control inputs compatible with LVC MOS levels
- Flow-through architecture for optimum PCB design
- Latch-up performance exceeds 100mA
- ESD >2000V per MIL-STD-883, Method 3015; >200V using machine model (C = 200pF, R = 0)
- Maximum operating frequency: 340MHz
- Available in 96-pin LFBGA package

APPLICATIONS:

- Ideally suited for DDR2-400/533 (PC2 - 3200/ 4200) registered DIMM applications
- Along with CSPU877/A/D, zero delay PLL clock buffer, provides complete solution for DDR2-400/533 DIMMs
- SSTU32864 is optimized for DDR2 Raw cards B and C
- SSTU32864A is optimized for DDR2 Raw card A
- SSTU32864C/D/G are optimized for DDR2 Raw cards A, B, and C
- SSTU32864G has control pins for output slew rate control

DESCRIPTION:

The SSTU32864 is a 25-bit 1:1 / 14-bit 1:2 configurable registered buffer designed for 1.7V to 1.9V V_{DD} operation. All clock and data inputs are compatible with the JEDEC standard for SSTL_18. The control inputs are LVC MOS. All outputs are 1.8V CMOS drivers that have been optimized to drive the DDR2 DIMM load.

The SSTU32864 operates from a differential clock (CLK and \overline{CLK}). Data are registered at the crossing of CLK going high and \overline{CLK} going low.

The C0 input controls the pinout configuration of the 1:2 pinout from the A configuration (when low) to B configuration (when high). The C1 input controls the configuration from the 25-bit 1:1 (when low) to 14-bit 1:2 (when high).

This device supports low-power standby operation. When the reset input (\overline{RESET}) is low, the differential input receivers are disabled, and undriven (floating) data, clock, and reference voltage (V_{REF}) inputs are allowed. In addition, when \overline{RESET} is low all registers are reset, and all outputs are forced low. The LVC MOS \overline{RESET} and Cx inputs must always be held at a valid logic high or low level.

To ensure defined outputs from the register before a stable clock has been supplied, \overline{RESET} must be held in the low state during power up.

In the DDR2 DIMM application, \overline{RESET} is specified to be completely asynchronous with respect to CLK and \overline{CLK} . Therefore, no timing relationship can be guaranteed between the two. When entering reset, the register will be cleared and the outputs will be driven low quickly, relative to the time to disable the differential input receivers. However, when coming out of a reset, the register will become active quickly, relative to the time to enable the differential input receivers. As long as the data inputs are low, and the clock is stable during the time from the low-to-high transition of \overline{RESET} until the input receivers are fully enabled, the design of the SSTU32864 must ensure that the outputs will remain low, thus ensuring no glitches on the outputs.

The device monitors both \overline{DCS} and \overline{CSR} inputs and will gate the outputs from changing states when both \overline{DCS} and \overline{CSR} inputs are high. If either \overline{DCS} or \overline{CSR} input is low, the device will function normally. The \overline{RESET} input has priority over the \overline{DCS} control and will force the inputs low. If the \overline{DCS} control functionality is not desired, then the \overline{CSR} input can be hard-wired to ground, in which case the set-up time requirement for \overline{DCS} would be the same as for the other D data inputs.

The SSTU32864G has two slew control pins (Z_{OH} and Z_{OL}) used to optimize the signal integrity on the DIMM.

NOTES:

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. The input and output negative voltage ratings may be exceeded if the ratings of the I/P and O/P clamp current are observed.
3. This value is limited to 2.5V maximum.
